

$q = 6$: cyclic pairs plus the missing antipodal pairs

regular starts, $d = 1$

six neighbor pairs

regular starts, $d = 2$

two three-cycles

virtual start, $s = 6$

three antipodal pairs

regular CTA: $(s, d) \mapsto \{s, (s + d) \bmod 6\}$, $s = 0, \dots, 5$, $d = 0, 1, 2$; $d = 0$ gives the six diagonal pairs

virtual CTA: $(6, d) \mapsto \{d, d + 3\}$, $d = 0, 1, 2$; these are $(0, 3)$, $(1, 4)$, and $(2, 5)$

$6 + 6 + 6 + 3 = 21 = 6(6 + 1)/2$ upper-triangular tile pairs, with no duplication
